Heft 76

Rotational Aspects
of Atmospheric Flow
Past Alpine-scale Orography

Zürich 1999
Geographisches Institut ETH

Contents

Preface	III
Acknowledgments / Dank	V
Abstract	VII
Zusammenfassung	IX

PART A

1	Introduction	3
2	Underlying Theoretical Concepts	4
	2.1 Gravity Waves, Wave Breaking and Pressure Drag	4
	2.2 Flow Splitting and Blocking	10
	2.3 Downslope Windstorms	14
	2.4 Gap Winds	18
	2.5 Vortex Streets and Wakes	19
3	Contents of the Papers	22

PART B

Rotational Aspects of Stratified Gap Flows and Shallow Foehn

	Summary	27
1	Introduction	28
2	Definition of model problem	32
3	Linear regime	34
4	Nonlinear regime	36
5	Sensitivity experiments	37
	5.1 Sensitivity to the topography's shape and size	38
	5.2 Sensitivity to upstream flow speed	40
6	Multiple flow solutions for $f=0$	41
	6.1 Sensitivity of standard nonlinear solution for $f \rightarrow 0$	41
	6.2 Existence and stability of multiple solutions for $f = 0$	42
	6.3 Externally induced transitions between multiple flow solutions	44
7	More realistic foehn-like settings	45
	7.1 Impact of deep valleys leading up to the gap-like pass	45
	7.2 Impact of surface friction	46
	7.3 Impact of an inversion	49
8	Concluding remarks	51

PART C

Linearized Flow over Isolated Orography: The Influence of Rotation

	Summary	55
1	Introduction	56

2	Problem Description, Linear Theory and Numerical Model	57
2.1	Problem Description	57
2.2	Linear Theory	58
2.3	Nonlinear Simulations	59
3	Axisymmetric Mountain	60
3.1	Upstream Stagnation	61
3.2	Downstream Stagnation	63
3.3	Upper-level Flow Reversal and Wave Breaking	65
3.4	Intersection of Isentropes with Lower Boundary	66
4	Elliptical Mountains	67
4.1	Upstream Stagnation	68
4.2	Downstream Stagnation	70
4.3	Upstream Flow Reversal and Wave Breaking	71
4.4	Intersection of Isentropes with Lower Boundary	71
4.5	Angle of Attack	72
5	Conclusions and Further Remarks	74

PART D

The Modification of a Front by the Alps: A Case Study Using the ALPEX Reanalysis Data Set

	Summary	79
1	Introduction	80
2	Numerical Model, and Initial and Lateral Boundary Conditions	82
2.1	Modelling System	82
2.2	The ALPEX-IIIb Analysis from DWD	84
3	Comparison of ALPEX versus ECMWF reanalysis	85
4	Synoptic and Mesoscale Weather Development	86
4.1	Approaching Cold Front and Flow Splitting	86
4.2	Cold-Air Outbreak and Mistral	89
4.3	North Foehn	89
4.4	Cyclogenesis in the Lee of the Alps	92
4.5	Anticyclone and Bora	94
5	Sensitivity Study	95
5.1	Effects of Orographic Height	95
5.2	Effects of Surface Friction	96
5.3	Effects of Diabatic Processes	97
6	Conclusions and Outlook	98

PART E
