

Marc Philipp Spirig

A Learning Strategy for Swinging Motions of an Inverted Pendulum

Master Thesis

Institute for Dynamic Systems and Control
Swiss Federal Institute of Technology (ETH) Zurich

Supervision

Sebastian Trimpe
Prof. Dr. Raffaello D'Andrea

January 2011

Contents

Preface	i
Table of Contents	iv
Abstract	v
1 Introduction	1
1.1 Motivation	1
1.2 Objectives	1
1.3 Methods	2
2 Background	3
2.1 The Double Inverted Pendulum	3
2.2 Prior Work	4
3 Analysis of the System Dynamics	5
3.1 Equations of Motion	5
3.1.1 Lagrange Equations of the Second Kind	5
3.1.2 Projected Newton-Euler Equations	8
3.2 Influence Analysis of Applied Torque, Gravity and Centrifugal Forces	9
3.3 Fundamental Differences in Balancing about Downward and Upward Equilibrium	11
4 Balancing Controller Design	15
4.1 Balancing Control Architecture	15
4.2 Balancing Controller for Downward Equilibrium	16
4.3 Balancing Controller for Upward Equilibrium	19
4.4 Stability, Controllability and Robustness Analysis of the two Equilibria	21
4.5 Basin of Attraction	27
5 Learning a Swinging Motion	29
5.1 Overview of Different Learning Approaches	29
5.2 Learning Objective	30
5.3 Learning Motivation and Specification	31
5.4 Single Parameter-Based Learning Approach	33
5.5 Application of the Single Parameter-Based Learning Approach . . .	33
5.6 The Multiple Parameter-Based Learning Approach	36
5.7 Application of the Multiple Parameter-Based Learning Approach . .	39
5.7.1 Two-Parametric Learning - Variable Main Acceleration	39
5.7.2 Two-Parametric Learning - Variable Main Velocity	43
5.7.3 Two-Parametric Learning - Braking Manoeuvre	44
5.8 Determining Equilibrium Points	48
5.9 System Sensitivity	48

6 Summary	57
6.1 Conclusion	57
6.2 Outlook	58
6.3 Additional Contribution	59
A Proof - From SIMO to SISO Nyquist Stability	61
Bibliography	64
